

Simulated Handwriting Data:

Confidential Field Log - Site Gamma-17

Date: 19/11/2025

Time: 14:15 Hrs.

Observation Notes:

Found the access panel slightly ajar. Temperature reading seems high, maybe 45°C, but my thermometer battery is low, so verify this later.

The main circuit board label reads: "Phoenix Ind. Rev. B-4." Note, this is different from the spec sheet (which listed Rev. A). Need to check inventory for spares. Only 3 bolts securing the housing—one missing from the top left corner. This could be why the environmental seal failed.

Need to purchase:

- *New thermal paste (high conductivity)*
- *3x M5 10mm stainless steel bolts*
- *A reliable thermometer*
